Lift

At one school building, there is a lift that can serve unlimited number of people. But there is a weight limitation: if the total weight of its passengers is more than W then the lift will stop working.

Task

Given the weights of n students. Find the maximum number of students that can get on the lift (and it is still working).

Input

On the first line, there are two integers: \mathbf{n} (1 < \mathbf{n} < 1000) and \mathbf{W} (0 < \mathbf{W} < 2,000,000). Next \mathbf{n} lines: each line contains an integer, weight of each student.

Output

Output the maximum number of students that can get on the lift.

Example

Input	Output
5 11	4
